

VERIFYX

VERIFY BEFORE YOU TRUST.

AI-powered visual verification for physical workplace conditions.

• LIVE

• ON-DEVICE

• EXPLAINABLE

THE PROBLEM

VISUAL INSPECTION IS EASY TO MISS.

Critical spatial conditions are difficult to judge consistently.

01 • Human visual judgement

Subjective and prone to inspector fatigue across daily routines.

02 • Difficult spatial relationships

Clearances and pathway boundaries cannot be judged by eye reliably.

03 • Disconnected remediation

Issues are flagged manually without verifiable evidence of a fix.

CORE INSIGHT

DETECTION $\neq$ VERIFICATION

Detecting an object is not the same as verifying compliance.

VERIFYX turns visual detection into an explainable verification workflow.

THE PRODUCT

POINT. VERIFY. FIX.

Real-time browser-local inspection interface.

LIVE SCAN

Target scene via mobile or desktop camera

DETECT

Run on-device YOLO11n ONNX inference

EXPLAIN

Evaluate geometric rules and state reasons

RESCAN

Confirm physical hazard removal before exit

SYSTEM ARCHITECTURE

FROM CAMERA TO VERDICT.

A 6-stage deterministic pipeline running client-side.

Camera frames are processed locally in the browser; they are not transmitted to external servers.

CLOSED-LOOP VERIFICATION

SEE IT. FIX IT. VERIFY IT.

Actual dataset detection evidence compared against clearance verification.

BEFORE · OBSTRUCTION DETECTED

AFTER · RESCAN VERIFIED

POSSIBLE OBSTRUCTION → CLEARANCE VERIFIED

COMPETITIVE ADVANTAGE

NOT JUST A DETECTION.

A fundamental shift from subjective observation to deterministic verification.

TRADITIONAL

- ✗ Human visual judgement
- ✗ Subjective reasoning
- ✗ Manual remediation
- ✗ Fragmented evidence

VERIFYX

- ✓ **AI detection**
- ✓ **Spatial reasoning**
- ✓ **Before/After rescan**
- ✓ **Structured evidence**

VERIFIED EXECUTION

BUILT. TESTED. DEPLOYED.

Fully verified implementation running on production infrastructure.

24 / 24

13 Spatial Rule Tests · 11 Report Lifecycle Tests

ROADMAP

THE VERIFICATION LAYER CAN GROW.

A clear distinction between what is implemented and what comes next.

TODAY

Working verification engine

- YOLO11n ONNX in browser
- 5 spatial safety rules
- Closed-loop rescan flow
- Structured JSON export

NEXT

Custom rules, APIs, Integrations

- User-defined rule schema
- REST & Webhook push APIs
- Facility management export
- Batch multi-item audit

FUTURE

Tamper-evident records, Multi-camera workflows

- Cryptographic audit logs
- Multi-camera sync
- Automated work order trigger
- Spatial digital twin mapping

Prototype verification rule engine — not a certified safety compliance system.

THE NEW STANDARD IN FACILITY AUDITS

DON'T JUST TRUST IT. VERIFY IT.

Built • Tested • Deployed
